

'mats' (monica agent transfer system) is a light-weight and compact system designed to empty and back-flush munitions or TIC (Toxic Industrial Chemical) containers once they have been accessed with the 'monica' system.

'mats' system in flight-case

In common with the 'monica' system **mats** is powered by compressed air, and will rapidly and controllably decant even highly viscous fills from targets.

Once the target fill is removed, fully sealed decontamination of a range of vessels is possible without exposing operatives or their environment to the vessel's contents at any stage in the process.

Decontaminant or other solutions may be introduced into, and then removed from the target any number of times until all target contents have been neutralised.

The **mats** system can also be used for *in situ* neutralisation of target contents in situations where removing and then destroying target contents is inadvisable.

In common with all our products it is designed to be simple and intuitive to use even when wearing full Personal Protective Equipment (PPE).

The **mats** is provided packaged in a standard size ruggedized 'Peli-Case' with an all-up weight of under 10Kg.
